

Cloud Observer

Cloud Instances Discovery and Management

Highlights:

- Automatically discover any cloud instances and associated network information across multiple clouds
- Expand visibility and bring valuable insight on cloud instances from a single pane of glass to enable cost control, reporting and audit
- Reduce operating costs by providing the state of cloud instances and identifying unused resources
- Improve risk management and compliance with better and accurate data
- Enrich network security by determining the attack-surface across on-premise and cloud
- Elaborate or further develop Network Automation through the use of secure open APIs

Maintaining cloud instances is a tremendous challenge. Ensuring an accurate view of the provisioned resources requires efficient processes and time, which many teams simply do not have due to their daily operational activities. In addition, with the rapid adoption of multi-cloud, IT departments are not always aware of all the new applications being produced and deployed by organizations. Complexity is further amplified due to knowledge, skills, access and non-uniformity across clouds.

Cloud Observer from EfficientIP has been developed to address these challenges, and equip your teams such as ITOps or NetSecOps with an easy-to-use, powerful and secure discovery tool to detect, track, and consolidate information on any provisioned cloud resources and networks. The information is presented via a central, and unified network management interface and through open APIs.

Cloud Observer At a Glance

By monitoring your cloud-provisioned resources including network properties, Cloud Observer provides comprehensive visibility of cloud instances deployment and usage and the necessary data reports to reclaim or detect any cloud instances, improving risk management and compliance.

Offering insight and a consolidated view on your cloud assets from a single pane of glass also simplifies daily operations and increases overall efficiency. You can delegate common administrative actions while remaining in control of your cloud instances. Thanks to its open APIs, you can also easily integrate Cloud Observer as part of your end-to-end automation process and save time.

Through the central and unified management, Cloud Observer enables you to quickly identify state, usage and capacity including IP addresses' changes over time, as well as access insightful analytics and reporting improving the control of costs and network capacity planning process.

Key Benefits

With Cloud Observer, your company can:

- Obtain centralized valuable insight on Cloud Instances and associated networks plus their usage and resources from a single pane of glass for better management and/or audit purpose
- Unify and standardize information about Cloud instances across multiple clouds
- Monitor resource changes and state for accountability and cost optimization
- Track instances across clouds to locate them in case of suspicious activity, usage, state and inventory purposes, improving your risk management and compliance
- Increase operational efficiency by using secure APIs to extract data and feed your automation processes
- Reduce the time spent on resource-draining troubleshooting sessions with clearer visibility of the cloud and how it is utilized

Key Features

Networking and Instances Discovery

Cloud Observer uses plugins to discover instances and related networking in the cloud, one plugin per cloud provider. These plugins utilize the APIs of the cloud provider to crawl and discover what is deployed and present this in a harmonized and unified way.

The supplied plugins are Amazon AWS, Google GCP, Microsoft Azure, VMware vCenter as well as a Customizable "External" plugin that can be used to interface with other clouds or systems other than the ones provided by EfficientIP.

Cloud Observer also takes care of keeping the data up-to-date and accurate.

Data Visualization

Cloud Observer discovers different information and metadata of instances as well as the networks associated with the cloud, harmonizing the data from multiple cloud providers and giving access to it in a unified way. The data organization and standardization enables users to easily visualize resources across any cloud environments at a glance, and view, for instance, all VPCs attached to an application in a region.

The data and metadata of Cloud instances includes but is not limited to:

- Name, last date of status change, status, CPU, Operating System, memory, storage, instance type,
- Virtual Private Clouds or other Networks,
- Addresses: Public IP Address, MAC address,
- Tags or labels that are metadata dependent on the cloud provider. If populated at the time of creation of the instance, it includes but is not limited to Owner, Environment, Application, Cost Center, Availability Zone, Region.

Name	Status	Same status for	Worker	Plugin	Type
Abushi	Up	32 d 00:15:29	AWS eu-west-1	Amazon EC2	t2.micro
Ace	Down	10 d 00:12:57	AWS eu-west-3	Amazon EC2	t2.micro
Ampy	Down	10 d 00:12:57	AWS eu-west-3	Amazon EC2	t2.micro
Amy	Up	4 d 19:43:36	Azure	Microsoft Azure	Standard_D2s_v3
Benga	Up	10 d 00:12:57	AWS eu-west-3	Amazon EC2	t2.medium
Cally	Down	32 d 00:15:29	AWS eu-west-1	Amazon EC2	t2.micro

Information is organized in “folders” for easy navigation and filtering and reporting purposes. It includes folder name, number of instances, number of IP addresses, first date of discovery, date of last update, last date of status change, status and more.

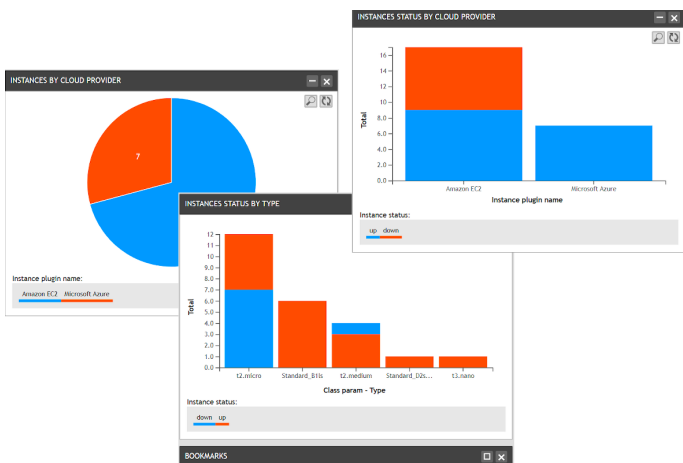

Name	Nb. of instances	Nb. of IP addresses	Worker	Plugin
AzureBackup_francecentral_1	0	0	Azure	Microsoft Azure
AzureDNS	0	1	Azure	Microsoft Azure
cloud-shell-storage-west europe	0	0	Azure	Microsoft Azure
EMEA-DEMO	0	0	Azure	Microsoft Azure
EMEA-POC	1	2	Azure	Microsoft Azure
ResourceGroup	0	0	Azure	Microsoft Azure
DeliveryLab	0	0	Azure	Microsoft Azure

Data Tracking

Cloud instances can be tracked over time and changes in the IP addresses or status reflected into Cloud Observer enhancing risk management and ensuring compliance.

Data Reporting

You can also get valuable analytics including the IP space usage of the number of instances per Region or Type, including their running state.

Cloud Observer offers rich ways to export data including CSV, HTML, XML, EXCEL or PDF by picking from a list the information to display in the report. The reports can be generated immediately or scheduled.

Alert Creation and Management

From the web interface, you can create alerts on the views of instances of your choice according to defined criteria and add them to your bookmarks. You can then insert alerts in your DDI dashboard including their bookmarks for quick retrieval and viewing. You can also be informed of a new alert by email helping to better manage risks and meet compliance.

Integration

Cloud Observer gathered information can be pushed toward other management modules. The solution is tightly integrated with the SO-LIDserver™ DNS DHCP IP Address Management (DDI) solution and its related modules such as Network Object Manager. This allows a quick population of automatically discovered instances and networks (Virtual Private Clouds) with total control over how they will fit in the Network Object Manager repository as an example. This helps to fuel and develop a complete reconciliation between what is stored in the database, and what is configured on the various Cloud instances, associated networks and their resource statistics and usage.

REV: C-220913

As one of the world's fastest growing DDI vendors, EfficientIP helps organizations drive business efficiency through agile, secure and reliable network infrastructures. Our unified management framework for DNS-DHCP-IPAM (DDI) and network configurations ensures end-to-end visibility, consistency control and advanced automation. Additionally, our unique 360° DNS security solution protects data confidentiality and application access from anywhere at any time. Companies rely on us to help control the risks and reduce the complexity of challenges they face with modern key IT initiatives such as cloud applications, virtualization, and mobility. Institutions across a variety of industries and government sectors worldwide rely on our offerings to assure business continuity, reduce operating costs and increase the management efficiency of their network and security teams.
